Importations des années...
A.—Importation plus forte que celle de 1858, malgré les entrées nautiques de la guerre civile, à cause de la vente de stocks.
B.—Importation due à la guerre civile, de qui on dit encore plus forte si quelques nations n'avaient débarqué leurs flottes.
C.—Importation due à la croissance naturelle de la production de coton Américain dont on ne débarquait pas les stocks assez importants.
D.—Augmentation de l'importation due au commerce de la guerre civile.
E.—Augmentation considérable parmi les débarquements de la guerre civile, à cause de l'ouverture de la Vérité.
F.—Augmentation due au succès par le Mexique et à l'engorgement des ports.
G.—Augmentation due à la croissance énorme du flot de nouvelles plantations à cultiver dans l'Inde et aux premières ventes du Japon.
H.—Augmentation due à celles en vrac qui sont sorties après la guerre grâce à la révolution.

CARTE figurative et approximative des quantités de COTON BRUT importées en Europe en 1858 en 1864 et en 1865,

Dressée par M^e MINARD, Inspecteur Général des Ponts et Chaussées en retraite.

Paris, le 14 Mai 1866.

Les tonnages de coton transportés sont représentés par les longueurs des voies colonisées à raison d'un millimètre pour cinq millions de tons, de plus exprimés par les nombres écrits en travers des voies et dont l'unité est nelle tonnes.
Les Cartes ont été dressées sur les Documents des Douanes Françaises, Anglaises, Belges, Hollandaises, Autrichiennes, Le Dictionnaire du Commerce, le Trade of Cotton de M.J.A. Morris, le retour circulaire de la publication Sisterfels de Liverpool, le Merchant's Magazine de New-York, l'Economist de Londres, la revue Corse d'Alexandrie etc.

Observation: Les importations sont un peu plus fortes que celles de la Carte parce qu'il n'y a pas de ligne de front de la guerre civile et que les Douanes donnent en blanc les trois premières expéditions de cette provenance, je n'ai pas à la prendre en compte.

De l'importation du Coton en 1865. — La guerre civile américaine entre dans des phasés nouvelles depuis que la guerre civile de cette Union d'Amérique a éclaté.

Depuis les portes du Globe qui communiquent avec l'Asie, l'Europe, l'Afrique et les îles, toutes ces voies sont occupées par l'Union qui a vaincu la Confédération de l'Amérique, mais aussi par de nombreux petits Etats qui débarquent dans l'Europe et l'Afrique. Ces derniers sont en état de faire leur commerce avec l'Europe et l'Afrique. Il y a donc augmentation importante de l'activité générale pour la production de cette plante textile.

Toute fois l'importation de 1865 est encore d'un ordre assez bas, au-dessous de ce qu'il avait été.

As malais des importations évoquées, on peut reconnaître à leur couleur, ou ceux qui sont importés depuis l'Asie, l'Europe, le Moyen-Orient, le Sud-Est de l'Asie et l'Australie, la Malaisie, l'Indonésie et l'Inde. Les autres sont ceux qui sont importés depuis l'Afrique, ou ceux de la Compagnie Britannique Orientale et de la Compagnie des Mamelles Importantes.

Cette carte semble peu donner le fond de l'Asie de l'Est, mais c'est à cause de l'exploitation du Canal de Suez, alors qu'il n'a pas encore été construit.

Ensuite nous arrivons à la bataille épique des trois Pays grande production de coton. L'Etat-Unis qui cherche à conquérir le monde, dont le pays n'a pas encore été débarqué, mais qui a été débarqué par l'Asie et l'Europe.

Les deux dernières parties de la carte sont celles qui sont plus compliquées. Elles sont dédiées aux îles de l'Océan Indien et de l'Océan Atlantique. Elles sont très compliquées et doivent être étudiées avec soin.

Voici les grandes productions, dont nous débarrasserons, qui sont en place dans le monde, mais qui sont dans l'Asie et l'Europe.

Voici les grandes productions, dont nous débarrasserons, qui sont en place dans le monde, mais qui sont dans l'Asie et l'Europe.

Voici les grandes productions, dont nous débarrasserons, qui sont en place dans le monde, mais qui sont dans l'Asie et l'Europe.

Voici les grandes productions, dont nous débarrasserons, qui sont en place dans le monde, mais qui sont dans l'Asie et l'Europe.

Electricity from renewables became cheaper as we increased capacity – electricity from nuclear and coal did not

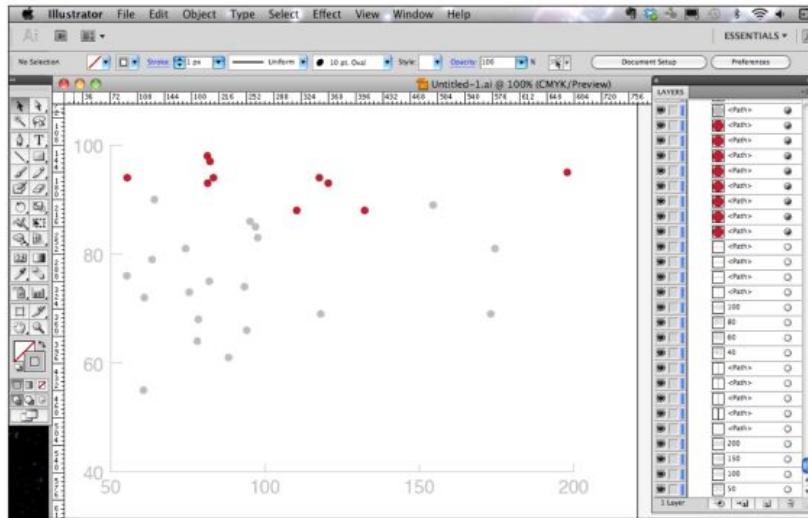

Source: IRENA 2020 for all data on renewable sources; Lazard for the price of electricity from nuclear and coal – IAEA for nuclear capacity and Global Energy Monitor for coal capacity. Gas is not shown because the price between gas peaker and combined cycles differs significantly, and global data on the capacity of each of these sources is not available. The price of electricity from gas has fallen over this decade, but over the longer run it is not following a learning curve.

DATAVISUALIZATION.CH SELECTED TOOLS

All Maps Charts Data Color

Arbor.js
A library of force-directed layout algorithms plus abstractions for graph organization and refresh handling.

CartoDB
A web service for mapping, analyzing and building applications with data.

Chroma.js
Interactive color space explorer that allows to preview a set of linear interpolated equidistant colors.

Circos
A software package for visualizing data in a circular layout.

Cola.js
A library for arranging networks using constraint-based optimization techniques.

ColorBrewer
A web tool for selecting colors for maps.

Cubism.js
A library for creating interactive time series and horizon graphs based on D3.js

Cytoscape
An application for visualizing complex networks and integrating these with any type of attribute data.

D3.js
A small, flexible and efficient library to create and manipulate interactive documents based on data.

Dance.js
A simple data-driven visualization framework based on Data.js and Underscore.js

The website features a red header bar with the site name and a search bar. Below the header is a navigation bar with tabs for All, Maps, Charts, Data, and Color. The main content area displays ten cards, each representing a different visualization tool. Each card includes a thumbnail image, the tool's name in bold, and a brief description. The tools shown are Arbor.js, CartoDB, Chroma.js, Circos, Cola.js, ColorBrewer, Cubism.js, Cytoscape, D3.js, and Dance.js.

Explanation

physical, social, political, and economic structures of a region can place residents at varying risks for vulnerability. Areas susceptible to violence or natural disaster pose clear threats to individuals. An individual's environment also affects his or her development and behavioral choices. Resources available in the physical and social environments create the contexts within which decisions are made about health, education, and employment. Political and social environments also dictate whether resources are accessible to all adolescents. An examination of the residential distribution of adolescents provides a baseline for comparing geographical patterns of vulnerability. Within Uganda, by type of residence, the majority of adolescents (87 percent) live in rural versus urban areas. Figure 6 shows the distribution of adolescents aged 10 to 19 living in Uganda. Regional distributions show Karamoja contains only four percent of the adolescent population. Kampala with a much denser population contains 4.6 percent of the population. The Eastern and Western regions contain the largest proportions of the adolescent population.

Household factors influencing vulnerability

Household-level factors have direct impacts on the well-being of adolescents. Households are the primary setting where adolescents live and engage in activities. For this reason, the household environment and the people who live there have significant impacts on the lives of adolescents. Physical conditions of the home influence the health of residents. Family structures and demographic characteristics of household members affect the knowledge, decisions, behaviors and interactions in the environment of the adolescent.

Access to improved water sources and sanitation

Unsafe water, inadequate sanitation, and poor hygiene are among the five leading risk factors responsible for one quarter of all deaths in the world (WHO 2009). Unsafe water supplies and inadequate sanitation in homes increase exposure to water-borne diseases and can cause diarrhea. Ensuring access to clean water sources and sanitation is key to maintaining hygiene and health. Improved water sources are those that either naturally protect water from contamination or are constructed to do so. These include piped water, public taps, standpipes, boreholes, tube wells, protected wells and springs, and rainwater collection. Improved sanitation includes constructs and systems that prevent fecal contamination. These include flush or pour toilets, ventilated pit latrines, pit latrines with slabs, and composting toilets (UNICEF 2013b).

Housing conditions across East and Southern Africa are largely in need of improvement, and lack of improved sanitation varies by country. In nearly all of East and Southern Africa, over half of adolescents either do not have improved sanitation or share facilities with other households. Conditions are worst in Madagascar and Mozambique where fewer than four percent of adolescents live in households with improved sanitation that is not shared (Figure 7). Rwanda has the lowest proportion of adolescents affected—35 percent—which is still unacceptably high. Lack of access to improved water sources affects lower proportions but is still a problem in the region. In five countries, fewer than half of adolescents have access to improved water sources (Figure 8). Water conditions are best in Namibia, where only 15 percent of adolescents have no access to improved water.

In Uganda, overall access to improved water and sanitation increased by a small but significant percentage between 2006 and 2011 (Figure 9). In 2006, 33 percent of adolescents had no access to improved water; in 2011, it is 30 percent. The proportion of adolescents without access to improved

The Average
7.3 babies born
per minute

Eat First
More births of all types
occur right after lunch

Day Shift

Births peak around 8 A.M.,
then rise again between noon
and 1 P.M. Hospitals typically
have more doctors and nurses
on hand during the morning
and fewer later in the day.

The Average
447 babies born per hour

Fewest Births
Sunday night
between 2 and 3 A.M.

Early Riser

More babies than average
are born on weekdays during
daylight hours. Fewer are
born on weekends or at night,
primarily because fewer
hospital staffers are on duty,
so women tend not to schedule
their delivery then. Despite
folklore, a full moon has no effect.

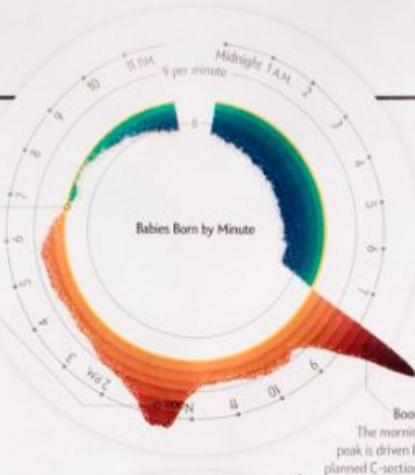

The Average
77,000 babies born per week

No, Thanks
Moms do not schedule C-sections
around Thanksgiving

Happy Holidays
Babies seem to arrive
nine months after Christmas
and New Year's Eve

Summer Son

Evidently, more people have
sex during colder months,
leading to more births nine
months later from July through
October, and less sex during
warmer months.

The morning
peak is driven by
planned C-sections

Midday Special
On a typical Tuesday,
770 babies are born
from noon to 1 P.M.

The Baby Spike

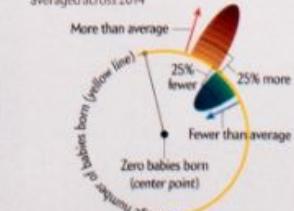

Births peak on
weekdays during
daytime work hours

Two generations ago babies were born pretty much spontaneously, around the clock. But today in the U.S., about half of all births are cesarean sections prescheduled by Mom or deliveries induced by doctors concerned about the mother's or baby's health. These medical procedures have skewed the days of the week, and hours of the day, during which those little bundles of joy arrive.

The procedures dominate because more than 98 percent of infants are born in a hospital, despite what seems to be the rising popularity of home births. Far more babies now arrive on weekdays than on weekends, most between 8 A.M. and 6 P.M. "We can't schedule spontaneous labor, obviously," says Neel Shah, a physician and professor at Harvard Medical School. "But we can schedule delivery."

—Mark Fischetti and Zan Armstrong

07.May-13.May

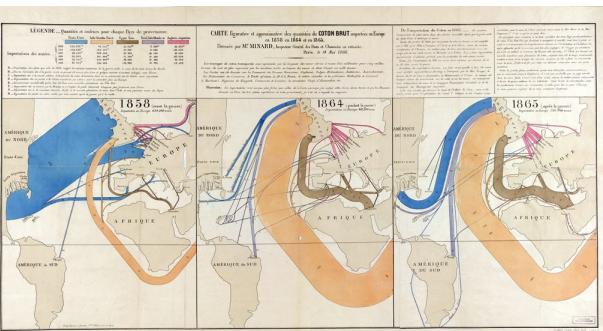

A cartoon strip illustrating a man's sleep cycle and his desire to swim.

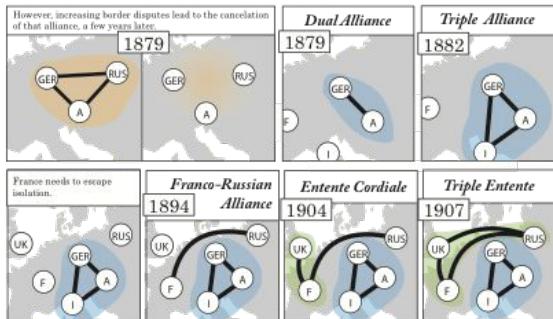

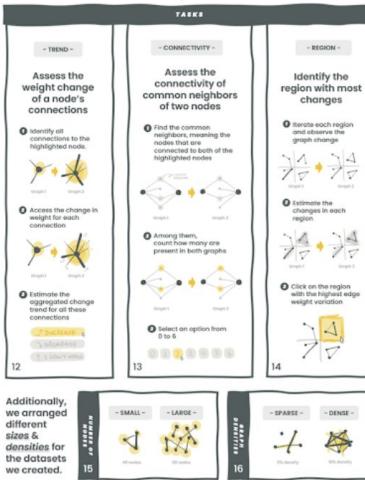

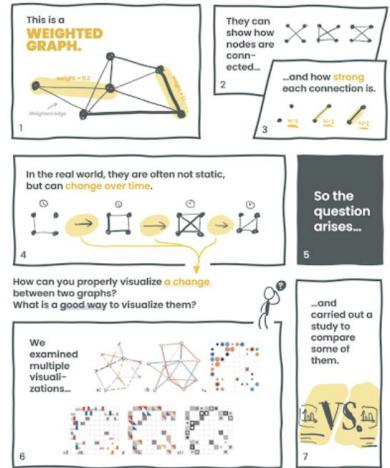

The top panel shows a man sleeping peacefully with a crescent moon above him. The text reads: "I WENT TO BED AT 1:35 ON AVERAGE". To the right is a pie chart titled "AND LACK OF DEEP SLEEP" showing the distribution of sleep stages:

Sleep Stage	Percentage
Deep	17%
Light	74%
Dream	9%

The bottom panel shows the man swimming in a pool, with a speech bubble saying: "BUT I WENT SWIMMING IN THE MORNING EVERYDAY!". Another character says: "WAIT!". The man replies: "BECAUSE...". The final panel shows the man swimming again, with a speech bubble saying: "THE SWIMMING POOL OPENS AT 11 ON SUNDAY!".

Context, Motivation & Problem Study

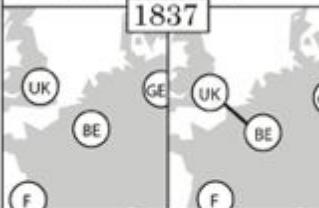

European Alliances before World War I (1836-1914)

1836 Imperial powers in Europe in the middle of the 19th century.

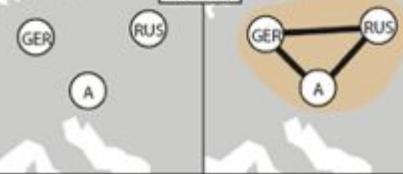

Britain signs a contract, supporting Belgium in case of violation of its neutrality.

German chancellor Bismarck successfully creates the Three Emperors Alliance between Germany, Austria and Russia...

1873

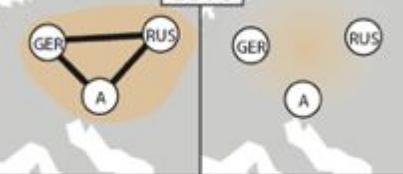

... leaving France isolated.

However, a few years later, increasing border disputes lead to the cancellation of that alliance.

1879

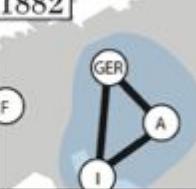

Later: **Dual Alliance**

1879

Triple Alliance

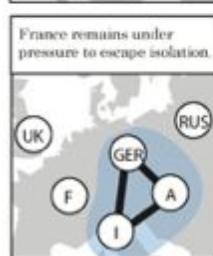

1882

France remains under pressure to escape isolation.

Franco-Russian Alliance

1894

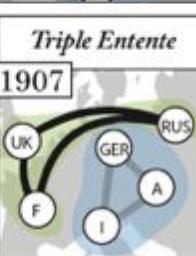

Entente Cordiale

1904

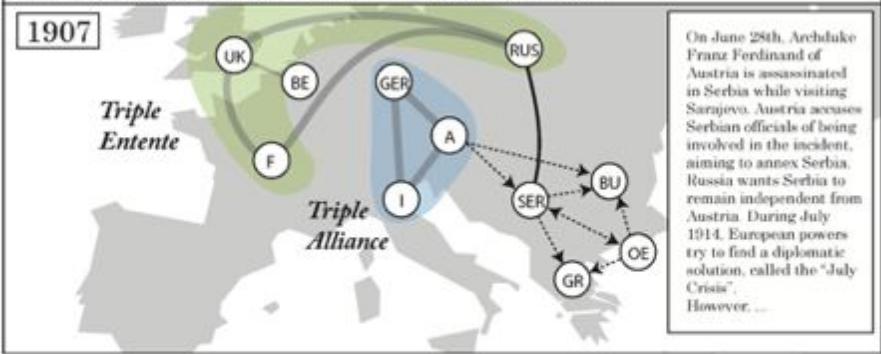

Triple Entente

1907

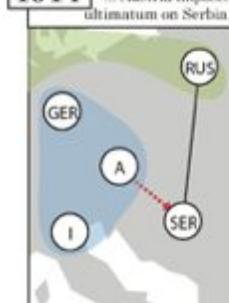

In 1907 the most important European powers are divided into two major alliances. On the Balkan, Serbia, Austria Greece and the Ottoman empire gamble for influence.

1907

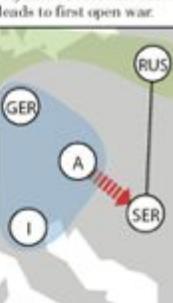

On June 28th, Archduke Franz Ferdinand of Austria is assassinated in Serbia while visiting Sarajevo. Austria accuses Serbian officials of being involved in the incident, aiming to annex Serbia. Russia wants Serbia to remain independent from Austria. During July 1914, European powers try to find a diplomatic solution, called the "July Crisis". However, ...

Context, Motivation And Problem Study

This is a
WEIGHTED GRAPH.

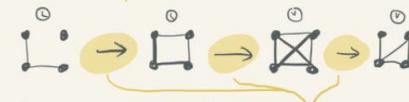

They can show
how things are
connected...

...and how **strong**
each connection is.

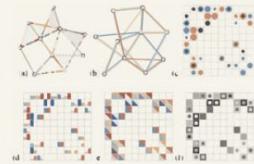

In the real world,
they are often not static,
and can **change over time**.

So the question arises...

How can you visualize the **changes**?
What is a better way to visualize them?

We examined multiple
solutions...

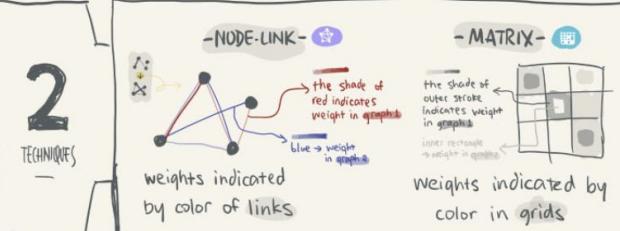

...and carried
out a study
to compare
some designs.

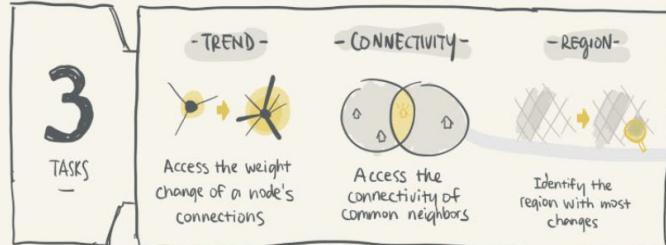

II

Tasks & Conditions

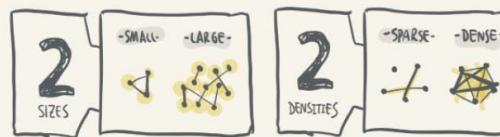

Though there are many existing visualization solutions,
most are based either on **node-link diagram** or **adjacency matrix**.
Let's call them two **techniques**:

To test which one is better,
we designed three **tasks**. They are frequently used in fields like
brain connectivity analysis:

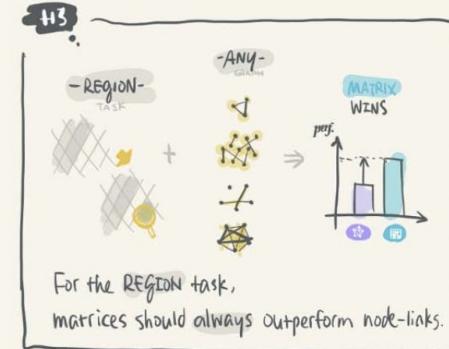

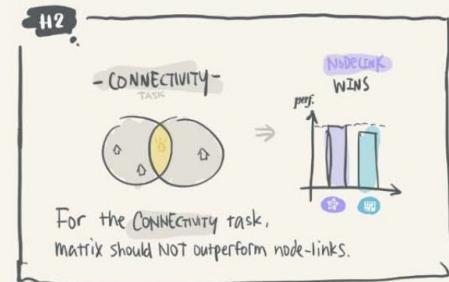

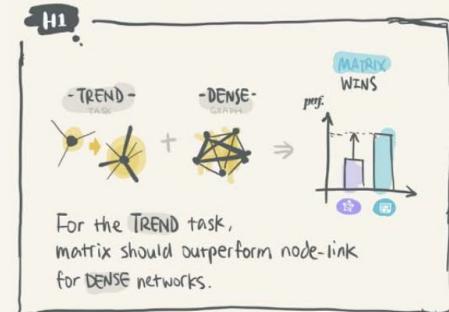

Additionally,
we have
different sizes/
densities for the
dataset.

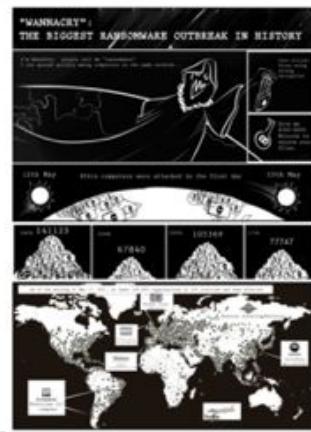

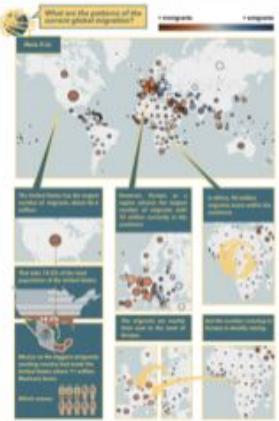

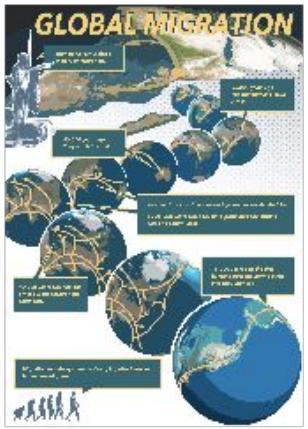

III

Hypotheses

We sought to verify that,

We start with a ring of n vertices

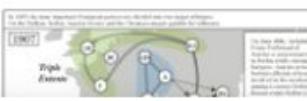

where each vertex
is connected to its
 k nearest neighbors

like so.

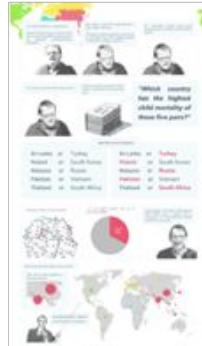

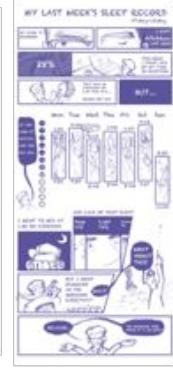

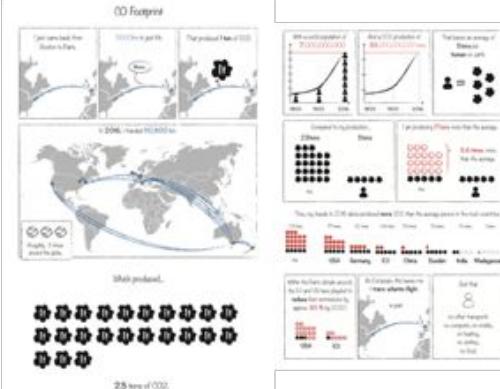

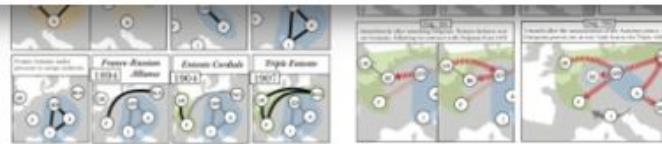

Next, we consider the edges that connect vertices to their second-nearest neighbours clockwise.

As before, we randomly rewire each of these edges with probability p .

Type	Description	#
OBSERVATION	Stating the obvious; point out specific data points or trends; express insights and interpretations	62
CONCLUSION	Taking a step back to provide an overview over the presented information and draw conclusions or call to action	29
HYPOTHESIS	Providing a speculative explanation to explain the presented information. This can range from tentatively asked questions to bold claims that introduce additional data to argue for an explanation	56
CLARIFICATION	Asking for information to better understand the data, a visualization or its insight	50
PROPOSAL	Propose future work and possible adaptations of the data or visualization	43
CRITIQUE	Feedback to the visualization author, ranging from expressing constructive feedback and pointing out improvements to disagreement with the visualization and contestation of data.	90
ADDITIONAL INFORMATION	Introduce additional information to allow people to better contextualize or relate to the presented data. Includes background information, comparisons with similar data, trivia, and links to external sources with additional data.	58
TESTIMONY	Providing personal information by speaking from first-hand experiences and sharing anecdotes or memories	41
OPINION	Providing a personal perspective by sharing opinions, but also feelings and emotional reactions.	92
OTHER	Unfitting in other categories, off-topic or not understandable reactions	19

Visualization Literacy

Visualization Literacy

Reading:

- Correctly decode (simple & complex) visual representations
- Know pitfalls and deceptions
- Think critically 'beyond' and see 'through' the visualization

Design:

- Create efficient and effective visualizations
- Design efficient and effective visualizations

Explore:

- perform tasks: ask and answer questions
- Interact with visualizations

Boxplot

Boxplots

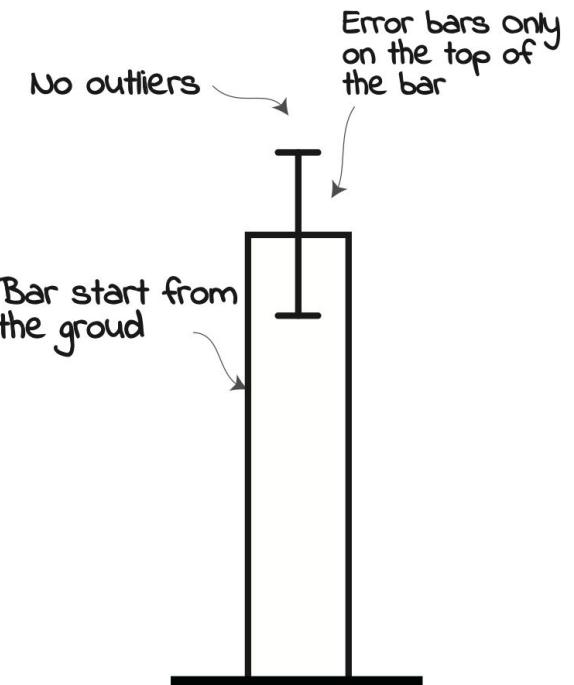

Candlesticks

A candlestick represents the price activity of an asset during a specified timeframe through the use of four main components: the open, close, high and low.

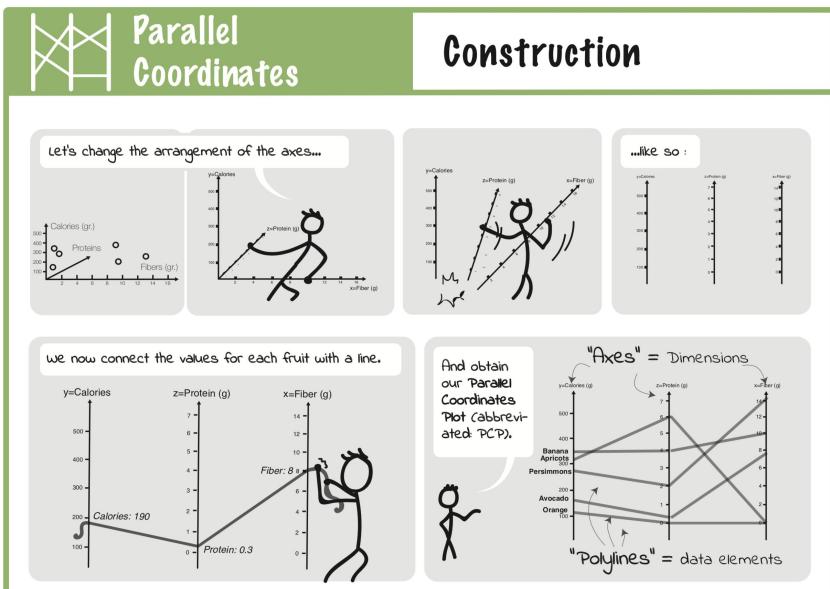

False-Friends

Error bars

Error bars are graphical representations of the variability of data and used on graphs to indicate the error or uncertainty in a reported measurement.

Parallel Coordinates

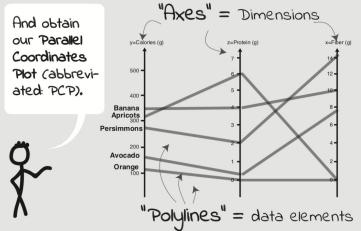

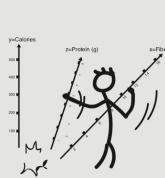

let's change the arrangement of the axes...

we now connect the values for each fruit with a line.

Construction

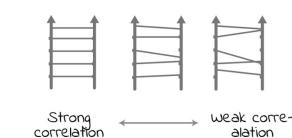

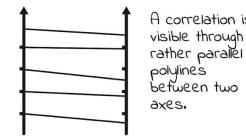

Parallel Coordinates

Parallel lines

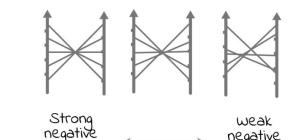

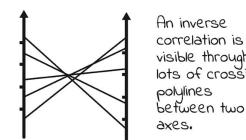

Positive Correlation

Correlations indicate that high values in one data dimension co-occur with high values in another dimension.

Correlations are not causations!

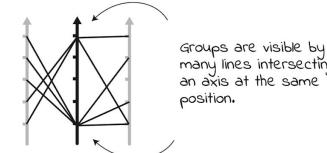

Visual Patterns

Crossing lines

Negative Correlation

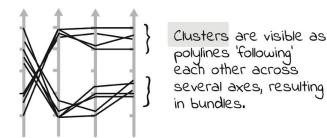

Inverse correlations indicate that high values in one data dimension co-occur with low values in another dimension.

Converging lines

Groups

Groups indicate many elements with the same value or similar values.

Grouped lines

Clusters

Clusters indicate data elements with similar values across several dimensions.

Visualization Cheat Sheets

Parallel Coordinates

Construction

let's change the arrangement of the axes...

we now connect the values for each fruit with a line.

And obtain our Parallel Coordinates Plot (abbreviated PCP).

Parallel Coordinates

Visual Patterns

Parallel lines

Positive Correlation

Correlations indicate that high values in one data dimension co-occur with high values in another dimension.

Correlations are not causations!

Crossing lines

Negative Correlation

Inverse correlations indicate that high values in one data dimension co-occur with low values in another dimension.

Converging lines

Groups

Groups indicate many elements with the same value or similar values.

Groups are visible by many lines intersecting an axis at the same position.

Grouped lines

Clusters

Clusters indicate data elements with similar values across several dimensions.

Clusters are visible as polylines 'following' each other across several axes, resulting in bundles.

Parallel Coordinates

Pitfalls

Axis scales

Truncated axes

What is the Data Fair?

Our data fair brings together our Master students in Design Informatics at the University of Edinburgh and external partners (you!) to collaborate on data analysis and visualization. The goal is for the students to chose a real-world dataset and an associated 'challenge' over in our course 'Data Science for Design', running from October to December 2021. Within that course, **students will learn the basics of data analysis and visualization**. Their assignment requires them to analyze a data set (basic analysis and plotting) and work on a visualization project that can focus on exploratory or explanatory issues for data visualization. Students will work in groups of 3 students. Visit projects from the past years [here](#).
